**MOBILITY**

*is primordial to insure feed intake,  
welfare and animal performances.*

## ça ne marche pas...

Animal mobility has been overlooked in the race for better zootechnical performance.

## MORE MOBILITY

To move is essential to insure feed intake and performances

With an approach that combine nutrition and environment factors, we contribute to speed up zootechnical, economical and ecological performances and to improve welfare and animals locomotion.

DIETAXION by its interdisciplinary approach, supports feed industry actors to walk towards

### eco-performance :

- reducing mortality
- limiting antibiotics use
- improving feed efficiency
- reducing environmental impact

To optimize zootechnical performances is our common goal.

To achieve this, animals **must to walk to their ressources (feeders and drinkers)**. Locomotor disorders are considered as major factor of performance loss.

### 3 complementary strategies:

- to strengthen bones
- to strengthen muscles
- to promote a less contaminated litters

LOCOMOTION: 1<sup>ST</sup> KEY OF ANIMAL WELFARE AND GROWTH
